They do not verify correctness. Like most people say there are many cards like that. @JamesVamos, "I actually looked at that, but not really. All of them look like they are the same and I really couldn't tell you which

one I got. I'll ask one of my customers tomorrow." I just tested all of them for you. I removed your memory and put it in your motherboard and tested them all. If you look carefully, the memory that you have is XXXXXX. That is the same in all four slots, so the slots on the bottom are the same. The only difference is, I did not have a multi-buffer configuration. I only tested it in single buffer. In the photo, the stick that was installed with the button is the stick that was installed in your motherboard. And these are the sticks I purchased for my own test. I could not believe that all these sticks are identical. So, don't think about other peoples' posts, check the stick that you have. We have the same "issue" with Gateway. PNY has issued a replacement for one of my systems - the motherboard, without replacement RAM. But Gateway has not yet. I have been given the option of trading in the motherboard for a different one. Memtest86 is an independent and unofficial application designed to test the functionality of your PC's memory, eliminating the possibility of faulty hardware or memory modules by performing a test mode on each memory address in your system. The Memtest86 product suite consists of the following programs: * MemoryTest86, a multi-test application that allows you to select a test pattern. * Memtest86+, a more extended version of MemoryTest86, that also includes some diagnostic tests. * Memtest86+/Pro, the more advanced version of the MemoryTest86, Memtest86 and Memtest86+ suites. I'm using Windows 7 Ultimate 64 bit and my computer has 4 GB of RAM. Windows says there is no problem. Is there any app which can be downloaded from Microsoft Store for memory testing? I want something which is like memtest86 but not the same. A: The app you want is called Memtest86. It comes with the OEM Windows 7 installation, for a limited number of years. It's basically the same as the memtest86+ edition that comes with the retail Windows 7. This article shows you how to access it. There are online versions of it, too. Q: PHP array_multisort - how to get specific value of array I have an array which looks

like this: Array ([0] => 100.000001 [1] => 100.000001 [2] => 100.000001) I'd like to sort it and get 100.000001, but i can't figure out how to do that The actual array is more complex, but i'll add a simplified version here. Edit My data is stored like this: Array ([0] => 100.000001 [1] => 100.000001 [2] => 100.000001 [3] => 100.000001 [4] => 100.000001 [5] => 100.000001 [6] => 100.000001 [7] => 100.000001 [8] => 100.000001 [9] => 100.000001 [10]
