For a lot of people, their relationship with their health care provider is a lot like the relationship with their romantic partner. You hope that it lasts, you think about it, you keep the lights on, but ultimately if it just isn't working out, you try to work on other things. For me, my relationship with my long term health care provider is a lot like the relationship you have with your roommate. You think about it, you talk about it sometimes, but as long as he or she is providing the services you need, you make do. But my health care provider is a lot like my romantic partner. He or she is, by far, the most important person in my life. For some, that's because their heart goes out to people they see struggle with disease. And for me, it's because I need a lot of assistance in addition to the medications and devices that he or she prescribes. Part of the fear that comes with making a long term commitment with a health care provider or a romantic partner is that you hope the relationship is the thing that lasts, but you also worry about it being the thing that ends. So I hope that you don't think I'm being a schmuck when I say that if you're in a relationship, good or bad, with a health care provider -- or with your romantic partner -- you might start thinking about switching to another provider, or even ending the relationship because the provider won't, or can't, provide the level of care that you need. To illustrate this, let's look at a post by Dan Siegel, a psychiatry professor at the University of California, Los Angeles (UCLA), who studied the relationship between therapists and their patients. I've written about Dr. Siegel before, because he has an amazing track record in helping both academics and the general public think about the relationship between doctors and patients. In his post, Dr. Siegel looks at a study in which he and his collaborators asked patients to fill out a questionnaire after their doctor's visit and a month later. What they found is quite interesting. First, and this is key, the patients' views of the doctor were not related to their self-reported health ratings at the time of their doctor's visit -- indicating that patients see their doctors for the services they provide and not for the health of their patients. However, what was interesting is that as their relationship with the doctor deteriorated, patients' perceptions of

1. Field of the Invention The present invention relates to an apparatus for controlling a camera which performs automatic focusing and exposure operation when taking a picture. 2. Description of the Prior Art In a known camera, a focus position sensor and a light receiver both disposed within the lens barrel is moved relative to the lens barrel in response to a movement of the lens barrel so that the position of the lens barrel is sensed by the position sensor. Since the focus position sensor is arranged in the lens barrel, the sensor becomes bulky and difficult to assemble. In a known camera, a light receiver is moved relative to the lens barrel by a cam provided on a movable portion of the lens barrel in response to a movement of the lens barrel. When the lens barrel is moved in the direction of an optical axis, for instance, the light receiver is moved to a position in which a measurement of an incoming light amount is possible. Since the movable portion of the lens barrel is used in common for movement of the light receiver and for moving the lens barrel in the direction of the optical axis, the movement of the movable portion of the lens barrel and the light receiver become unstable. Further, the cam must be engaged with a driving portion of the light receiver, resulting in an unstable arrangement. In addition, the mechanical moving mechanism is large in size and increases the cost. Enrichment of proline-rich ligands on a glutamic acid-rich surface with a single N-terminal hydrophobic cluster. The stabilization of ligands in aqueous solution by local interactions with the membrane protein is a key step in the molecular recognition process. In this work we present a strategy to increase the local concentration of hydrophobic ligands when placed on the surface of a biological membrane. By utilizing the intrinsic hydrophobicities of short peptides that form amphipathic helices on membranes and self-assemble into globular aggregates, the effect of peptide length on stabilization of the aggregates on a glutamic acid (E)-rich membrane surface was investigated. Dimeric and trimeric peptides were used in order to reduce the total peptide concentration to a level at which the influence of dilution was negligible. Whereas aggregates of N-terminal dimeric peptides adsorbed to the surface, trimeric peptides did not adsorb. The trimeric peptide bound to the surface with the N-terminal amino group oriented perpendicular to the membrane. The N-terminal amino group was
