History Autodesk began marketing AutoCAD in 1982. Software for the company's previous products had been designed to run directly on an IBM PC compatible (IBM PC compatible). For this new software, however, an "operating system" was needed to provide the basic functions that made AutoCAD a piece of software a complete computer program. The operating system needed to be intuitive enough that one person could use it. Since it would be used by non-programmers, it also had to be designed to be straightforward and easy to use. The basic features, the type of data that could be entered into a drawing and the way the information in the drawing would be stored, were all figured out before the design of the operating system. It would be necessary to have some "menu" functions that would let users control the basic functions of the program. These functions needed to be separated from the basic drawing functions. In addition, the operating system would have to let the program handle text and graphics the same way, meaning that text and graphics data could be handled as a unit. The requirement that text and graphics be treated the same meant that the operating system would need to have a graphics mode. The first step in the design of AutoCAD was to create the operating system's "command line" interface. The design of the command line interface began in 1979. The first step was to determine the information that would be used to create a drawing. Once this information was decided, it was necessary to develop an easy-to-read list of commands that would allow users to do this drawing. The user would be able to choose which commands they wanted to use, and how to combine them. The operating system was designed to be small enough that it would fit in the memory of a typical PC of the time (early 1980s). Because the operating system needed to be small, it could not support all the commands that the new software would use. It also had to be easy to read, easy to understand, and easy to learn. Finally, the operating system needed to be designed to run on any PC. The process used to create the command line interface is a close model for the way that humans learn to use software. When we learn how to use software, we use commands in the order in which they appear on the screen. This order is related to the fact that in English, commands are generally spoken first, then they are written. When a person starts to learn

I do not know what they do and what's the difference? A: An SPA is a pattern that lets you build the frontend of an app with separate code. Usually this means React, React Native or Vue components, so the SPA is made of code and not a single page. SSR is a pattern that lets you build the backend of an app with separate code. You usually don't build the frontend for the backend (if you do, you are likely to have issues), you usually just
