The game's story concerns the events that took place on the small Scandinavian island, Gotland, during the summer of 1361. In 1360, the countries coastal town Visby, located on Gotland, was about to fall under the control of Danish military. King Valdemar Atterdag of Denmark lands his troops on the shores of the country's west coast and starts the invasion on Gotland. It is the summer of 1361. A small resistance of country yeomen takes up arms against the superior invaders. The player, in the role of different characters, experiences the story from a first-person perspective. The main character on Gotland is Jonas, a fisherman who has decided to take up arms against the superior invaders. The game is about 1-2 hours long and is focused on narrative storytelling with a twist: the combat (the Quick time events) is fully turn-based strategy! Players will have to choose from different character classes and develop a strategy to defeat the enemy. Characters will have different resources and use them to help attack and/or defend against the enemy. Players can get supplies from sources that will replenish their resources as well as being able to sell their resources to the same merchants they would normally find selling their goods. The game is made with Unreal Engine. The Battle of Visby is fully playable with a controller. The Battle of Visby supports AO, keyboard and movement through gamepad support. Project History Origin Finnish developer Jukka Jokipakka had previously worked on the "Darkest Hour" series of stealth games. He was inspired by the idea of the battle of Queen Isabella with Ferdinand II of Castile. He was also inspired by the Games Workshop board game, The Battle of Hammerfest. Development Jukka Jokipakka started developing the project on his own. He opened his blog where he posted updates about the development. The project was funded through the crowdfunding service Kickstarter. The initial goal was to create a "walking simulator" and the game was planned to be released on Steam. In 2013, the project was changed into a strategy game. The Kickstarter was restarted to secure funding to create the game in full. The first release build was released in August 2014. The game is playable through Steam's VR functionality. In December 2014, the game was released on Steam, as a first

ESPN's Buster Olney reports that Giants have inquired about Milwaukee Brewers outfielder Chris Carter, which could "push Pence's final choice down to two." 12:15 PM: The Yankees are one of the teams interested in Mets infielder Ruben Tejada, according to Andy Martino of the New York Daily News (via Twitter). They would obviously like to add more infield depth to their system, which is why the Mets are said to be listening on a trade, if anything, for Tejada. The Mets have interest in Cubs infielder Mark Mathias, but that doesn'

Poised to Take Ownership of New Media Increasingly, the screens to which we are accustomed are going mobile and increasingly, the Internet is becoming a display frontier where new interaction models, user experiences and dynamic applications are evident. Recent wireless communication systems technology developments promise a smooth transition from client-server to peer-to-peer communications, in which end users can communicate directly to one another. In this article, we summarize what this means for users and what open source technologies can bring to the party to improve the user experience. Open source Solar Sails is a research project under the ECAIL banner in Electrical Engineering at the Eindhoven University of Technology and that explores the idea of developing a device that can smoothly transition between the Internet and cellular networks when it is connected to a satellite. It can make use of a satellite bandwidth release and hop from one ground station to another when it is within range. This emerging scenario, referred to as peer-to-peer communications, is caused by the convergence of cellular and satellite mobile telecommunications networks. It is unique in that it makes use of some of the software provided by ECAIL and allows satellite platforms and terrestrial fixed facilities to directly connect to each other. Common assumption Today, the Internet is primarily accessed through mobile devices. However, traditional mobile devices (cell phones, tablets) only connect to the Internet in 3G networks. Going to 5G networks will increase bandwidth, but will not change the general assumption that a phone is a client connected to the Internet, nothing else. This means that a common challenge that is plaguing programmers and web developers is how to provide applications that are 'mobile-ready'. That is the challenge of pushing a Web application to a device with an Internet connection that has limited bandwidth. 'Mobile-ready' means that the application should not overload the device's CPU and memory, retain high quality as the device moves around, and the user should be able to access it on any network and over any connection. Open source Although the possibilities for cellular networks are exceedingly varied and span the spectrum ranging from LTE to LTE Advanced, one of the more promising concepts supported by standards bodies in recent years is to shift the client-server relationships to peer-to-peer. This shift is closely related to dynamic application deployment via software updates (for example, change support), and can be summarized as "push" or "pull" technology. Among other things, "push
