Understanding the layers Every image has a set of layers. These are the main component of the image itself, and you can add and remove them to get the effect that you want. Photoshop organizes layers into five modes, including the new Type layer. These are a grouping of layers that have a common theme or function. For example, a custom layer is a group of layers with a function; the Background layer is a group of layers that is usually used to create the background of the image; and the Type layer is a group of layers that is used to create text and signs. Photoshop organizes all layers into groups and subgroups. A group is a collection of layers that work together as one entity, and a subgroup is a secondary collection of layers that can be added to another group.
