"There are no words needed for describing the atmosphere of worlds that are brought to life by the game. You can feel the atmosphere, which encompasses the world during the calm and troubling times. This is simply the most fascinating thing in the game." --Xenon on Multiverse "A very interesting VRMMORPG game, not to be missed."
--Kiren Lel on Multiverse "An enjoyable, challenging and beautiful game that will keep you tied to your seat till the end." --Cancea on Multiverse "I had no idea what the story would be about and that was the best part. The characters were interesting and the landscapes were exquisite. The MMO world I created along with the ARPG gameplay gave a sense of isolation and loneliness but it was in a good way." --Dreary P on Multiverse About We are a First-person Online Game (MOBA,FPS,RPG), in which you have the ability to combat monsters in high contrast and complicated environments through the latest in-game graphics and animation. We are developing the world of the game with the feel of a fantasy movie. Toys, manga, and traditional literature readers will recognize the Unexplored world of fantasy. The fantasy genre is characterized by high contrast, unique scenes, and three-dimensional and emotive characters. In addition, in the game we are implementing the following elements with the idea of breaking through the boundaries of existing genres. First, a character will be able to develop a variety of weapons, and a player will be able to freely combine weapons, with a completely different combat situation depending on the character's will or item. Second, the player will be able to establish an outstanding story and have an incredible adventure. Third, the game is built with a free-moving camera, allowing a player to feel the atmosphere, which fills and surrounds a player. Fourth, player characters interact with the world in an online environment, allowing for the close inter-player relationship. We are developing the game world in the form of maps that are built from detailed tiles, making it possible for player characters to move to open regions, as well as gameplay in the various special environments of the world. As a game developer, we aim to create the best fantasy- bff6bb2d33

Multiple sclerosis (MS), also known as disseminated sclerosis, is the most common cause of neurological disability in young adults. After a latency period of about 10 years, the disease is manifested by recurrent attacks of neurologic dysfunction, resulting from inflammation and demyelination of the central nervous system. The inflammation and demyelination can damage axons as they traverse the white matter, resulting in a range of functional deficits including paralysis, sensory impairment, optic neuritis, and cognitive impairment. Although the course of multiple sclerosis is variable, the majority of patients eventually develop a chronic, progressive, and debilitating neurological disease that adversely affects quality of life. In addition to its significant impact on the quality of life, multiple sclerosis can be a progressive disease. Multiple sclerosis can cause disability and disease progression that in some cases can include permanent impairment of bodily functions (often, but not always, motor functions of the body), and permanent damage to the brain, spinal cord, and related nerves (including optic nerves). As many as 3 in 4 people with multiple sclerosis who have a first attack of the disease will have a second attack. Over the course of a decade, about half of all people with multiple sclerosis will have a second attack. Current medical treatment for multiple sclerosis generally involves the use of one or more immunomodulatory agents that reduce or suppress inflammation in the central nervous system or modify the course of disease. These agents include beta interferon, glatiramer acetate, natalizumab, fingolimod, and dimethyl fumarate, among others. However, approved immunomodulatory therapies for multiple sclerosis often cause significant adverse reactions and are associated with low levels of sustained efficacy. For example, patients treated with interferon-beta are at risk for a wide range of adverse events that can include flu-like symptoms, fatigue, autoimmune disease, and other adverse events. Patients treated with glatiramer acetate commonly experience adverse events, including fatigue, which may be unrelated to the underlying disease or treatment. Natalizumab, which is an antibody that blocks the receptor $\alpha 4\beta 1$ of lymphocytes, is associated with a high rate of progressive multifocal leukoencephalopathy. All of these therapies are associated with potential serious adverse reactions and can result in treatment interruption or a change in therapy. As a result, multiple sclerosis patients often must take multiple different medications in a treatment regimen over the course of the disease. The oral administration of plant-based medicines offers great potential in the treatment
