
Erowid Methamphetamine Shake N Bake [WORK]

in a separate flask, ephedrine is added to potassium carbonate and then potassium iodide is added to the ephedrine-potassium carbonate mixture with stirring and heating. the dmsO is then added to the flask and the solution is stirred and warmed over a water bath. the solution is boiled and a slight color change (from a slightly yellow solution to a bright green) indicates that the meth has begun to crystallize. the mixture is stirred constantly to prevent crystallization of the meth. after about 2 hours at 85c, the meth is completely crystallized and the solution is filtered using a buchner funnel and a cellulose filter. when the meth is poured into a glass tube, the solution quickly filters out and a characteristic yellow-green color is present. the meth is then extracted from the glass tube with hydrochloric acid and 1 n hydrochloric acid for one hour and then filtered. the meth is allowed to dry in a vacuum oven for five hours and is then dissolved in acetone. this solution is filtered and the meth is then precipitated with anhydrous sodium sulfate and is filtered to remove any free ephedrine. the meth is then passed through a column of activated alumina and is washed with a chloroform. finally, the meth is placed in a glass container and is then recrystallized using anhydrous sodium sulfate. when the meth is ready to be used, a solution of the meth is prepared by mixing it with roughly 3 g of acetic anhydride in a flask and then adding a small amount of concentrated hydrochloric acid. the hippocampus is also affected directly by methamphetamine, because large doses of the drug inhibits the reuptake of serotonin in this brain region. [26] the effect of methamphetamine on sert is probably specific, because it is not mimicked by amphetamine and amphetamine changes neither brain serotonin nor dopamine levels.
