Logicmaster 90-30 V9.05 Software Download

hey guys, i'm not sure exactly how to do this but i'm going to give it a try. i just got my logicmaster last week and i'm just starting to learn it and i'm looking for the simplest way to get it to do certain operations. so is there anyone out there that can help me out the ge fanuc ic663ka971 cpu module is an advanced 16-bit multibus microcomputer. there are a total of 24 interfaces in the ic663ka971 cpu module, which provide 4 i/o channels and 2 memory interfaces. it features a 16-bit parallel bus and a 16-bit serial port. the ic663ka971 cpu module is divided into three sub-modules: processor module, serial module, and the analog-digital converter module. each sub-module is a microprocessor, with separate registers and memory locations. the processor module is a single-chip 16-bit cpu for the microcomputer. the analog-digital converter module, which performs up to 1.5 analog-digital conversion times, depends on the serial module. the serial module is a 16-bit, 400-parallel-bit serial port for the microcomputer. the ic663ka971 cpu module has an output frequency of 1.5 mhz. it has two peripheral control units, 16-bit address bus, 16-bit data bus, 32-bit data bus, 16-bit interrupt control unit, and 4 serial port bus. this cpu module has an external 8-bit program memory which is available for writing new code. a program may also be loaded into external memory using the external bus control unit. the program can be loaded and saved when the program is being edited and tested, and you can save at least two programs to external flash memory or eeprom memory. in order to run programs in the flash memory, just copy the program into it, and restart the microcomputer for the program to run. the serial module has separate 16-bit buses for control, data, and address. this module provides the four i/o data paths for the cpu module, serial module, and the analog-digital converter module. these paths are controlled by a separate control address. 5ec8ef588b
