JMusicMan is a player for music files and is optimized to offer the best and most user-friendly interface to edit the most important metadata for a wide range of audio files. JMusicMan is a special playback application for audio files. JMusicMan can be played (with crossfade or random play) and used as a media player. With the

JMusicMan player the different tags (authors, albums, genres etc.) of the music files can be edited. With the simple and powerful tag editor the properties like title, composer, artist, album, genre, year of release, track length, bit rate and many more can be edited. For the construction of a music collection it is necessary to know a lot about the music files. The complete collection is provided in a database for quick and easy access. If you want to organize your music collection in the right way you have to be familiar with the basic rules of the file system. When you edit the metadata of a file in JMusicMan you can select the source and target folder of a file. All music files in the source folder will be merged into one entry in the database of the target folder. To bring all the metadata (in this case the selected tags) of the music files in the database the music files have to be sorted. This can be done by using the build-in playlist function. To support all those who are still working with a pure list of tracks there is a new special playlist function. In addition to this playlist a queue can be used. In the queue you can mark a song as a favorite and the list of favorites can be viewed in the playback window. The database is accessed via the DBManager with all metadata and ID numbers in a much easier and user friendly way. To give you the best experience it is recommended to work with the full screen mode, it is available in the configuration options. Features: • Create/Edit songs, playlists, album entries, genres • Charts, playlists, favorites, genre tree • Music file players (PC, Mac, Linux) • Play music by crossfade, random, shuffle • Sort/Favorites, queue • Library/Database Manager • Organize music collection with multiple tag source folders • Automatically transpose from key and from genre Audio Widgets Plugin Description Description: A replacement audio player.
