In Japan, assisted vaginal deliveries in hospital settings are nearly nonexistent. The country has a high rate of home births. Our study evaluated the incidence of spontaneous labor in women delivering at home in Japan. We used a large-scale registry of home births registered in Japan. We identified all events of spontaneous labor, defined as labor that began at home without medical intervention. There were 63,773 births registered in 2005 and 59,847 in 2006. Spontaneous labor was detected in 5951 (9.8% of births) in 2005 and 2867 (5.2% of births) in 2006. The rates of spontaneous labor in

unassisted vaginal deliveries were 9.0% in 2005 and 4.8% in 2006. It appears that the Japanese society has a tradition of home births and an obstetrical model of care that includes more than medical intervention for births at home.

Effect of prooxidants, such as Cd^{2+} , Zn^{2+} , Mn^{2+} , and H_2O_2 , on glycol chitin formation and morphology of enzymatic chitosan production. Glycol chitin is an important precursor of bio-based chitosan. The formation of glycol chitin was affected by prooxidants. While the formation of chitosan increased by a factor of 4-7, the average molecular weight of the glycol chitin decreased from $>20\text{kDa}$ to 17kDa . Correlation studies showed that the formation of glycol chitin was increased with an increase of chitosan concentration, pH, temperature, and the addition of prooxidants. Increase of temperature and/or pH and addition of prooxidant were needed for glycol chitin formation, while chitosan formation did not require these conditions. Addition of prooxidant increased the N/C ratio of chitosan due to degradation of glycol chitin by prooxidant. The N/C ratio of chitosan depended on the oxidation mechanism, which was influenced by

prooxidants..354 (0.352,0
