Web applications have long excelled at some tasks, such as being platforms of record for online file sharing or appointment scheduling. But they have never excelled at the same types of tasks that desktop software does best -- that is, portraying a photo for the web, editing it through layers, and manipulating it to represent information in the desired way -- until now.

In a blog post this week, Adobe announced that it would bring Photoshop to the web with a toolset that includes "the classic Photoshop features you know and love, such as editable layers, vector tools and more," along with a "new web-native user experience in the browser and mobile web that's optimized for the desktop in mind." Essentially, developers can write one file and load it in the browser to show a live version of Photoshop for the web. In addition, the new browser plugin NYTimes Portfolio will be released in Q3 this year and should make it easier for photographers to show their work to the world.

The actual tools used for the new web-based Photoshop are implemented largely using Web Components frameworks, such as lit-html and Service Worker . For example, the toolbox for the export function is handled as a custom element in jQuery and, once exported, is added to the DOM using an HTML template. Some support for the UI is also browser-specific, with layers and selections being gotten from existing browser's UI libraries, such as `Chrome for Workers`. Final implementation details such as the painting and tooling, however, are highly browser-specific.

The canvas is actually being loaded to a canvas element, which can in turn be assigned to another canvas element. The latter essentially functions like a container element the same way that does in an HTML file.

The full source code for HTML and CSS created for Photoshop can be found on GitHub , which has a website shared with a tutorial on the concepts used to build the application. The JavaScript used here is pure ES2018 , and can be evaluated in modern browsers with the import command.
