When you grab the image, there is an outline around the layer as well as the black outline around the entire frame. This only appears when there is “no bus in the present”. The only way to get rid of that is to use the step backwards button, and, of course, you’ll have to “chain” the frames first. Even without chain mode, you’ll be waiting a few seconds for it to process. Although this is a minor annoyance, it would be nice if the image had a frame transparency to avoid having this glow around the frame. In the earlier versions of Adobe Photoshop, it was possible to tag an image for recall later. Plus, it was possible to search for these tags in a database, which allowed you to quickly search a collection of images based on tags that may not have otherwise been readily available. Now, not so much. Lightroom 5 has a search engine that allows you to search images through a variety of fields, including tags, star ratings, keywords, title, and description. However, if you get many images with the same tag name, it may not be as helpful as it once was. Other than that, the search engine can be quite accurate. But, if you’re using Lightroom 5 as a catalog, you can’t search through easily through specific tags in catalogs that don’t include 1 of your 20 tags or a related one. So, ideally, when developing a network application that must run without an Internet connection, the application itself should be designed so that it can live offline and at least save the changes made in the local session, for example in a SQLite database. Photoshop is changing that.
