i. Batch Processing in Lightroom . Batch processing allows you to process multiple clips and/or images at once without having to open them individually. You can save time and effort by completing your edits on a single file rather than switching back and forth between each image. These commands are typically found under the Control menu in the graphics area of the application.

ii. Overlay Layers . This feature allows you to name layers and manipulate them on top of one another. You can easily duplicate or combine layers by choosing Edit >> Merge, Merge Down, or Create Clipping Mask. This tool is particularly helpful when you need to combine multiple elements or effects into a single layer.

iii. Screen Recorder . The Screen Recorder allows you to capture a full Photoshop document (at any resolution) and create a compilation of all the steps to complete a particular design. The clips can then be played back, enabling you to see each step of the creation process.

iv. Quick Fix . Photoshop Elements has a comprehensive Quick Fix feature that you can use to quickly and easily correct color balance, exposure, brightness, and contrast problems. Simply select the problem portion of your photo and click on the Quick Fix button under the Adjustment panel. You can then select which aspect of the photo you'd like to modify to correct the problem.

i. Style Manager . The Style Manager lets you create custom style sets and use templates to apply them to specific image types. You can save and reuse them for future projects, and achieve consistency with other designers.
