Server, Fabulatech Serial Port Splitter V432 Incl 21 All software and hardware components for data transmission should be correctly installed. We ask our visitors to note that they have received the information and that they were aware of the possible use of all goods under certain limitations. Development of cell-based assay and its application to immunodiagnosis of foot-and-mouth disease. Cell-based assay based on monoclonal antibodies (MAbs) has been recognized as a promising method in the detection of small molecules in body fluids. In the present study, the receptor (LepA) of foot-and-mouth disease virus (FMDV) was identified, which may play an important role in viral infection. Two positive-charged monoclonal antibodies (MAbs) against LepA protein were produced using the recombinant protein as an immunogen, and their binding activity with FMDV was identified using indirect enzyme-linked immunosorbent assay. The results showed that both MAbs could recognize the LepA protein expressed in Escherichia coli, and the reactivity of MAbs was similar to that of the natural epitope. Since the natural epitope is mainly located at the C-terminus of LepA, two MAbs specifically reacted with the C-terminal peptide. In addition, the sensitivity and specificity of these MAbs were satisfactory. The results of indirect enzyme-linked immunosorbent assay suggest that these two MAbs may be applied as an important part of a cell-based assay in the diagnosis of FMD. Blood flow analysis in rat uterus: ultrasonic Doppler and microsphere techniques. Tissue blood flow can be defined as the volume of blood per unit of tissue per unit of time; it must be analyzed by different methods, and their results must be compared with each other. Here it is proposed a new method of blood flow assessment in rat uterus by microsphere and ultrasonic Doppler (UD) methods. Microspheres (15 microm mean diameter) were infused into the left ventricle of the heart, and the animals were killed, and the
